The present invention describes a novel enzymatic nucleic acid (ENA) having a harmmerhead mocification at position 4 of the ENA; (iii) at 2. (2-allyl modification at position 4 of the ENA; (iii) at least ten 2. 0-methyl modification at position 4 of the ENA; (iii) at least can inhibit collagenase and stromelysin production in the symovial ENA's membrane of joints for the treatment or prevention of arthritis, particularly osteoarthritis or rheumatoid arthritis. The ENA's can also be used to treat antigen presenting cells of a donor to induce tolerance in a recipient to an alloantion of a donor. They can also he used for enhancing graft tolerance or for treating autoimmune disease, and for reating allergies and other inflammercry conditions. The ENA's can also be used in diagnosis. Riboxyme therapy impacts on the expression of stromelysin without introducing the non-specific effects upon gene
                                                                                                                                                                                                                                                                                             Arthritic condition; graft tolerance; immune response; target; cleavage; hammerhead ribozyme; halfpin ribozyme; human; rabbit; mouse; collagenase; stromelysin; synovial membrane; joint; arthritis; osteoarthritis; rheumatoid arthritis; autoimmune disease; allergy; inflammation;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Enzymatic nucleic acid molecules having a hammer-head motif - used for the treatment of arthritis, induction of graft tolerance or treatment of auto-immune diseases.

control of various are allelic polymorphic markers found in the human genome (represented in AXX10269-X12937). These primers can be used in a genome (represented in AXX10269-X12937). These primers can be used in a method for determining polymorphic forms in an individual for use in e.g. forensics, paternity testing or for phenotypic typing for diseases such as agammaglobulinemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular dystrophy, Wiskott-Addrich syndrome, Fabry's disease, familial hypercholesterolemia, polycystic kidney disease, hereditary spherocytosis, von Willebrand's disease, tuberous sclerosis, hereditary spherocytosis, von Willebrand's disease, tuberous sclerosis, hereditary syndrome, osteogenesis imperfecta, acute intermittent porphyria, autoimmune diseases, inflammation, cancer, diseases of the nervous syndrome, osteogenesis imperfecta, acute intermittent porphyria, autoimmune diseases, inflammation, cancer, diseases of the nervous syndrome, carefinity, and susceptibility or receptivity to particular drugs or the rapeutic treatments. The isolated polymorphic nucleic acid segments can also be used to produce medicaments for the treatment or prophylaxis of such diseases
                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                AAX09121-X10268 are allele-specific oligonucleotide primers used in the
expression which accompany treatment with retinoids and dexamethasone. The concentration of ilbozyme required to affect a therapeutic treatmers loss lower than that required of antisense molecules, and is highly specific. The present sequence is used in the exemplification of the

AAV48709-886 represent antisense oligonuclectides directed against the ErbB-2 gene. Of these, only oligonuclectides AAV48709-91 resulted in significant redcution in ErbB-2 protein expression, while chigh in redcution in ErbB-2 protein expression, while considered the redcution in ErbB-2 protein effect. The oligonuclectides and intelled effect. The oligonuclectides and intelled effect. The oligonuclectides that can each form three hydrogen bonds to cytosine; do not contain four consecutive nuclectides able to form three H-bonds each to four consecutive cytosines; do not contain two sequences of three consecutive consecutive and the ratio between residues able to form two H-bonds each (2R) or three such bonds (3R) is given by 2R/3R = 0.33-0.72. The cytosines, and the ratio between residues able to form two H-bonds each (2R) or three such bonds (3R) is given by 2R/3R = 0.33-0.72. The consecutions are used to modulate expression of genes, particularly the genes for p53, ErB-2, junb, junb, TGF-beta 1 or beta 2 to control proliferation of primary cell cultures (e.g. bone marrow stem, liver or kidney cells, osteochasts, osteochasts and/or keratinocytes). The cligonuclectides can also be used to analyse function of proteins (by altering their expression or activity) and therapeutically, e.g. in cases of cancer or (targeting TGF) for stimulating the immune system
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Preparation of antisense oligo:nucleotide(s) which lack long runs of consecutive quancisine or incaine - and have specific ratio of residues able to form two or three hydrogen bonds, have greater activity and reduced toxicity, used therapeutically or to modulate growth of cells in

The tag sequences can be used to identify genes by matching the tag to a gen data base member, or by using the tag sequences as probes to isolate unidentified genes from cDNA libraries. The tag sequences can also be used in a method for diagnosing colon or pancreatic cancer in a sample euspected of being neoplastic. The method comparises comparing the level of at least one transcript in a first sample of a tissue to a being neoplastic and the second sample is a colonic tissue suspected of being neoplastic and the second sample is a normal human colonic tissue. The transcript is identified by a tag selected from AAX30947-31815. The methods of the invention can be used in the diagnosis, prognosis and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Use of isolated gene transcripts - useful for developing products for the diagnosis, prognosis and treatment of cancers, particularly colon and pancreatic cancer.

A method has been developed for the identification of a nucleic acid capable of modulating a process in a biological system. The method capable of modulating a process in a biological system. The method acid catalysts (NAC) having a substrate binding domain (SBD), comprising a caid catalysts (NAC) having a substrate binding domain (SBD), comprising a random sequence, and a catalytic domain (CD); and (b) identifying NAC in systems where modulation has occurred and/or determining the sequence of at least part of the SBDs in such systems. Nucleic acid molecules with endoantiess activity and catalytic activity, from the present invention, are used to modulate gene expression in plant and mammalian cells and to cleave target nucleic acid, particularly for treating systemic diseases caused by specific RNA, e.g. cancer, inflammation, psoriasis, non-happaic ascites and infection. They may also be used to detect genetic drift and mutations in diseased calls and to determine c-raf RNA. Specifically NACs with RNA-cleaving activity that modulate expression of the Raf gene are used to treat cancer, restenosis, psoriasis or rheumatoid arthritis, or of sused to treat cancer, restenosis, psoriasis or rheumatoid arthritis, or of sused to treat modification increases stability against muclease and activity. Apv90922 to Apv33877 represent NACs that can be used in the method, specifically for modulating the expression of a Raf gene
                                                                                   Human; c-raf; A-raf; B-raf; hammerhead ribozyme; hairpin ribozyme; target; substrate; catalyst; modulation; expression; Raf gene; delivery; screening; identification; synthesis; deprotection; purification; cancer; inflammation; psoriasis; non-hepatic ascites; infection; genetic drift; restenosis; rheumatoid arthritis; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Identifying new catalytic nucleic acid that modulates selected processes - especially ribozymes that cleave Raf RNA for treating cancer, restence;s, and also new ribozymes and modified nucleoside triphosphates used as antiviral agents and synthons.
                                              Target sequence with sequence homology to c-raf and A-raf position 2127

```
oligonucleotides AAV992B1-83 represent modified defibriotide sequences containing a Human immunodeficiency virus (HIV) homology region and a cellular regulatory factor. Defibriotide is a polyanion salt of a cellular regulatory factor. Defibriotide is a polyanion salt of a deoxyribonucleic acid obtained from mammalian tissue. The products can be used for treating disease such as infection, schistosoma infection, chistocraca Leishmania infection, Trypansoma infection e.g. Candida tropicalis and japonicum, Schistocarca Leishmania infection, Trypansoma infection e.g. Candida Ablacians, Aapsergillus infection, Pneumocystis carinii infection, candida Ablacians, Aapsergillus infection, Pneumocystis carinii infection, cytomegalovirus infection, Hepatitis virus infection, human papilloma control generatic diseases e.g. Duchenne's muscular dystrophy and Down's syndrome; degenerative disease, encephalopathy, dementia, Alzheimer's disease, Parkinson's disease, neuropathy, cardiomyopathy, cardiomyopathy, cardiomyopathy, cardiomyopathy, cardiomyopathy, control in a Sayre syndrome, retinitis pigmentosa, actaxia, selzures, proximal muscle weakness, Leber's retinitis pigmentosa, actaxia, selzures, proximal muscle weakness, Leber's syndrome, pancreatic cancer, neuropathy, optic neuropathy, optic neuropathy, cardiomyopathy, colon cancer; and skin disease, pancreatic cancer, lung cancer, and colon cancer; seborrheic dermatitis, psoriasis, Reiter's syndrome, insect colon cancer; and skin diseases, encated via administering the nucleic addition a drug resistance can be treated via administering the nucleic colon cancer and components of delibrotide and the variants in combination with the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                 encymatic nucleic acid, especially a harmwerhead ribozyme, which cleaves the Hepatitis C virus (HCV) RNA sequence at the base position given in the descriptor line. The HCV sequence as screened for optimal ribozyme target sites using a computer folding algorithm and regions of the mRNA which did not form secondary folding structures and contained potential ribozyme cleavage sites were identified. Ribozymes were synthesised to target these sites and their activities optimised by either varying the lungth of the binding arms or by modification to prevent degradation by viral replication, and are used to treat diseases associated with hepaticis C virus (HCV) infection, e.g. cirrhosis, liver failure and hepatoccellular carcinoma. The ribozymes may be used in combination with interferon to treat HCV infection, other infectious diseases, autoimmune
                                                                                                                                                                                                                                                                                                                                                                                                Novel ribozymes for the treatment of diseases and conditions related to hepatitis C infection.
                                                                                                                      Substrate for HH ribozyme HCV-5930 which cleaves HCV RNA at nt. 5930.

The present sequence represents the preferred target sequence of an enzymatic nucleic acid, especially a hammerhead ribozyme, which cleaves the Hepatitis C virus (HCV) RNA sequence at the base position given in the descriptor line. The HCV sequence was screened for optimal ribozyme target sites using a computer folding algorithm and regions of the mRNA which did not form secondary folding structures and contained potential ribozyme cleavage sites were identified. Ribozymes were synthesised to target these sites and their activities optimised by either varying the cleavage sites were identification to prevent degradation by nucleases. The ribozymes of the invention inhibit gene expression and/or viral replication, and are used to treat diseases associated with Hepatotisis C virus (HCV) infection, e.g. cirrhosis, liver failure and hepatotellular carcinoma. The ribozymes may be used in combination with interferon to treat HCV infection, other infectious diseases, autoimmune diseases, and cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

The present sequence represents the preferred target sequence of an enzymatic nucleic acid, especially a hammerhead ribozyme, which cleaves the Hepatitis C virus (HCV) RNA sequence at the base position given in the descriptor line. The HCV sequence was screened for optimal ribozyme target sites using a computer folding algorithm and regions of the mANA which did not form secondary folding structures and contained potential ribozyme cleavage sites were identified. Ribozymes were synthesised to target these sites and their activities optimised by either varying the carget these sites and their activities optimised by either varying the carget the binding arms or by modification to prevent degradation by nucleases. The ribozymes of the invention inhibit gene expression and/or viral replication, and are used to treat diseases associated with Hepatitis C virus (HCV) infection, e.g. cirrhosts, liver failure and hepatocellular carcinoma. The ribozymes may be used in combination with interferon to treat HCV infection, other infectious diseases, autoimmune
                                                                                                                                                                                                                                             Novel ribozymes for the treatment of diseases and conditions related to hepatitis C infection.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence represents the preferred target sequence of an enzymatic nucleic acid, especially a hammerhead ribozyme, which cleaves the Hepatitis C virus (HCV) RNA sequence at the base position given in the descriptor line. The HCV sequence was screened for optimal ribozyme target sites using a computer folding algorithm and regions of the mRNA which did not form secondary folding structures and contained potential ribozyme cleavage sites were identified. Ribozymes were synthesised to target these sites and their activities optimised by either varying the length of the binding arms or by modification to prevent degradation by nucleases. The ribozymes of the invention inhibit gene expression and/or viral replication, and are used to treat diseases associated with Hepatitis C virus (HCV) infection, e.g. cirrhosis, liver failure and hepatitis currinnant The ribozymes may be used in combination with interferon to treat HCV infection, other infectious diseases, autoimmune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ..

The invention relates to the isolation of sequences encoding human haemopoietin receptor protein family NR8 genes. The NR8 family sequences were initially searched for comparison on a nucleic acid database with the nucleic acid probe sequence TGRAGYNNNTGGAGY encoding the amino acid sequence TGPAGYNNTWGGAGY encoding the amino acid sequence Trp-Ser-Xaa-Trp-Ser. The sequences AAZ59258-Z59300 and AAZ90816-280925 represent specific examples of probe sequences used in the search. Antibodies to the NR8 family proteins are used for the diagnosis of blood formation disorders. Compounds identified as binding to the proteins are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Hemopoletin receptor protein family NR8 used for diagnosis of blood formation disorders.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to the isolation of sequences encoding human haemopoietin receptor protein family NR8 genes. The NR8 family sequences were initially searched for comparison on a nucleic acid database with the nucleic acid probe sequence TGGAGYNNNTGGAGY encoding the amino acid sequence Trp-Ser-Xaa-Trp-Ser. The sequences AAZ59258-Z59300 and AAZ90816-Z59325 represent specific examples of probe sequences used in the search. Antibodies to the NR8 family proteins are used for the diagnosis of blood formation disorders. Compounds identified as binding to the proteins are used for the treatment of such disorders
                                                                                                         The invention relates to the isolation of sequences encoding human haemopoietin receptor protein family NR8 genes. The invention relates to the isolation of sequences encoding human haemopoietin receptor protein family NR8 genes. The NR8 family sequences were initially searched for comparison on a nucleic acid database with the nucleic acid probe sequence TGGAGATNINTGGAGY encoding the amino acid sequence Trp-Ser-Xaa-Trp-Ser. The sequences AAZ59258-Z59300 and AAZ90816-Z59325 represent specific examples of probe sequences used in the search. Antibodies to the NR8 family proteins are used for the diagnosis of blood formation disorders. Compounds identified as binding to the proteins are used for the treatment of such disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to the isolation of sequences encoding human haemopoietin receptor protein family NR8 genes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to the isolation of sequences encoding human haemopoletin receptor protein family NR8 genes. The NR8 family sequences were initially searched for comparison on a nucleic acid database with the nucleic acid probe sequence TGGAGYNNNTGGAGY encoding the amino acid sequence Trp-Ser-Xaa-Trp-Ser. The sequences AAES5258-Z53300 and AAE30816-29025 represent specific examples of probe sequences used in the search. Antibodies to the NR8 family proteins are used for the diagnosis of blood formation disorders. Compounds identified as binding to the proteins are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Hemopoietin receptor protein family NR8 used for diagnosis of blood formation disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  .

Neocarzinostatin apoprotein synthetic gene useful as a chemotherapy agent for acute leukemia, bladder cancer and pancreatic cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           This invention describes a novel neocarzinostatin (NCS) apoprotein synthetic gene (I), apoNCS. The products of the invention can be used as a chemchbrapy agent for acute leukemia, bladder cancer and pancreatic cancer. This sequence encodes a fragment of the apoNCS protein described in the method of the invention
                                                                                                                                 Neocarzinostatin; NCS; apoprotein; apoNCS; chemotherapy; acute leukemia; bladder cancer; pancreatic cancer ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        C-1027 biosynthesis gene cluster; apoprotein; chromophore;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Length 15;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to the isolation of sequences encoding human haemopoietin receptor protein family NR8 genes. The NR8 family sequences were initially searched for comparison on a nucleic acid database with the nucleic acid probe sequence TGGAGYNNATGGAGY encoding the amino acid sequence Trp-Ser-Xaa-Trp-Ser. The sequences AAZ59258-Z59300 and AAZ90816-Z90925 represent specific examples of probe sequences used in the search. Antibodies to the NR8 family proteins are used for the diagnosis of blood formation disorders. Compounds identified as binding to the proteins are used for the treatment of such disorders
Antibodies to the NR8 family proteins are used for the diagnosis of blood formation disorders. Compounds identified as binding to the proteins are used for the treatment of such disorders

```
Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Antisense therapy, antiproliferative; antinflammatory, antipsoriatic; cytostatic; dermatological, cardiant; virucide, ophthalmological; keloid; skin disorder; Insulin-like Growth Factor I receptor; IGF-1; pityriasis; IGF binding protein; IGFB-2; IGFBP3; inflammation; psoriasis; pityriasis; growth factor mediated cell proliferation; ichthyosis; serborrhoea; ruba; keatosis; neoplasia; scaleroderma; wart; skin cancer; sclerotic disease; hyperneovascular condition; hyperplasia, kidney disease; neovascular condition of the retina; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an antisense oligonucleotide, (for Insulin-like Growth Factor [IGF]-1 receptor, IGF binding protein [IGFBF]-2 or IGFBF], which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotides of the present invention (see AAF45151 and AAF45153-61501). The method is useful for ameliorating the effects of psoriasis, ichthyosis, pityriasis, ruba, pliaris, serborrhoea, keloids, keratosis, ichthyosis, pityriasis, ruba, pliaris, serborrhoea, keloids, keratosis, hyperneovascular condition such as a neovascular condition of the skin, a brain or skin, growth factor-mediated malignancies, other sclerotic disease, kidney disease, hyperproliferation of the inside of blood
  useful for diagnosis of HMG-COA reductase mediated diseases such as dyslipidemia and other cardiovascular diseases such as myocardial infarction and stroke. HMG-COA reductase antagonist drugs are used to treat dyslipidemia and other cardiovascular diseases such as myocardial infarction and stroke
                                                                                                                                                                                                  0.5%; Score 11.8; DB 1; Length 15; 86.7%; Pred. No. 5.1e+02; tive 0; Mismatches 2; Indels

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present PCR primer was used to detect a polymorphism in the human 3-hydroxy-3-methylglutaryl-coenzyme A (HMG-CoA) reductase gene. The polymorphism is present in the promoter region, exon 15, introns 2, 5, 15 or 18. HMG-CoA reductase polymorphisms are useful as genetic markers in linkage studies. Detection of the presence of the polymorphisms is useful for assessing the pharmacogenetics of therepeuic compounds in the treatment of HMG-CoA reductase mediated diseases. The polymorphisms are
                                                                                                                                                                                                                                               The present invention is concerned with the elucidation of the gene cluster from Streptomyces globisporus which regulates enediyne C-1027 synthesis. Enediyne C-1027 is an antibiotic, consisting of an apoprotein and a non-peptidic chromophore, which causes damage to DNA. The primers AAA63353-A63451 were used to isolate the open reading frames which used to produce the protein and to identify antagonists, both of which can be used in the treatment of cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel polymorphisms in human 3-hydroxy-3-methylglutaryl-coenzyme A (HMG-CoA) gene useful for diagnosis and treatment of HMG-CoA reductase-mediated diseases such as dyslipidemia and other cardiovascular diseases
                                                                                               Isolated nucleic acid comprising a nucleic acid encoding any of C-1027 open reading frames (ORFs) -7 to 42, excluding ORF 9 (cagA), useful for the production of enediyne C-1027 antitumor antibiotics.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         3-hydroxy-3-methylglutaryl-coenzyme A reductase gene; dyslipidemia;

Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or inflammation.

Example 8; Page 70; 201pp; English

The present invention relates to a method for ameliorating the effects of antisense oligonucleotide, (for Insulin-like Growth Factor [IGF] receptor, IGF binding protein [IGFBP] - 2 or IGFBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inhibiting or reducing growth factor mediated cell proliferation, oligonucleotide which can be used to design the antisense oligonucleotide which can be used to design the antisense oligonucleotides of the present invention (see AAF4151 and AAF45153-155161). The method is useful for ameliorating the effects of psoriasis, neoplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperiovascular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic disease, kidney disease, hyperproliferation of the inside of blood ressels or any other hyperplasia

The present invention relates to a method for ameliorating the effects of akin disorders. The method comprises contacting the skin with an antisense oligonucleotide, (for Insulin-like Growth Factor [IGF]-1 receptor, IGF binding protein [IGFBP]-2 or IGFBB), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotide which can be used to design the antisense oligonucleotides of the present invention (see AAF4151 and AAF45153-F45161). The method is useful for ameliorating the effects of psoriasis, ichthyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, neoplasias, scleroderma, warts, benign growths, cancers of the skin, a prain or skin, growth factor-mediated malignancies, other sclerotic disease, kidney disease, hyperproliferation of the inside of blood
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an antisense oligonuclectide, (for Insulin-like Growth Factor [16F]-1 receptor, 1GF binding protein [1GFB]-2 or IGFBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonuclectide which can be used to design the antisense passion to the present invention (see AAF45151 and AAF45153-F45161). The method is useful for ameliorating the effects of psoriasis, ichthyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, neoplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovacular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic disease, kidney disease, hyperproliferation of the inside of blood
                                                                                                              Antisense therapy, antiproliferative, antinflammatory, antipsoriatic, cytostatic, dermatological, cardiant, virucide, ophthalmological, keloid, skin disorder, Insulin-like Growth Factor I receptor; IGF-1; pityriasis; IGF binding proctein, IGFB-2; IGFBP3; inflammation, psoriasis; pilaris, growth factor mediated cell proliferation; ichthyosis; serborrhoea; ruba, keratosis; neophasia; scleroderma; wart, skin cancer; sclerotic disease; hyperneovascular condition; hyperplasia, kidney disease; neobascular condition of the retina; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an antisense oligonucleoride, (for Insulin-like Growth Factor [IGF]-1 receptor, IGF binding protein [IGFBP]-2 or IGFBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, or inflammation and/or other disorders. The present sequence is an inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the artisense oligonucleotide which can be used to design the affects of psoriasis, chipyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, neoplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, chrowing disease, kidney disease, hyperproliferation of the inside of blood vessels or any other hyperplasia
                                                                                                                               Antisense therapy, antiproliferative, antinflammatory, antipsoriatic, cytostatic, dermatological, cardiant, virucide, ophthalmological, keloid, skin disorder, Insulin-like Growth Factor I receptor; IGF-1, pityriasis; IGF binding procein, IGFBP-2, IGFBP3, inflammation, psoriasis, pilaris, growth factor mediated cell proliferation; ichthyosis, serborinoea, ruba, kearcosis, neoplasia, scleroderma, wart, skin cancer, sclerotic disease, hyperneovascular condition, hyperplasia, kidney disease, neovascular condition, hyperplasia, kidney disease,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Edmondson SR;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            (MURD-) MURDOCH CHILDRENS RES INST.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Example 7; Page 45; 201pp; English.

Edmondson SR; Werther GA, Wra'ight CJ,

WPI; 2001-041421/05.

Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or inflammation.

Example 8; Page 63; 201pp; English.

The present invention relates to a method for ameliorating the effects of akin disorders. The method comprises contacting the skin with an antisense oligonucleotide, (for Insulin-like Growth Factor [IGF] receptor, IGF binding protein [IGFBP] or IGFBP3), which is capable inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotides of the present invention (see AAF45151 and AAF45153 oligonucleotides of the present invention (see AAF45151 and AAF45151 orbithyosis, pityriaeis, ruba, pilaris, serborrhoea, keloids, keratosis, neoplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic disease, kidney disease, hyperproliferation of the inside of blood disease, kidney disease, vessels or any other hyperplasia

IGF-I oligonucleotide #1753.

Antisense therapy; antiproliferative; antiinflammatory; antipsoriatic;

```
The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an antisense oligonuclectide, (for Insulin-like Growth Factor [GP]-1 receptor, IGF binding protein [IGFBP]-2 or IGFBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, of inflammation and/or other disorders. The present sequence is an oligonuclectide which can be used to design the antisense oligonuclectide which can be used to design the antisense oligonuclectide which can be used to design the antisense oligonuclectide is useful for ameliorating the effects of psoriasis, rethingosis, pityriasis, tuba, pilaris, serborrhoea, keloids, keratosis, neoplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperprise of the same an neovascular condition of the retina, brain or skin, growth factor-mediated malignancies other sclerotic disease, kidney disease, hyperproliferation of the inside of blood vessels or any other hyperplasia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or

IGFBP3 oligonucleotide #206. (first entry) 30-MAR-2001

Antisense therapy, antiproliferative; antiinflammatory; antipsoriatic; cytostatic; dermatological; cardiant; virucide; ophthalmological; keloid; skin discorder; Insulin-like Growth Factor I receptor; IGF-1; pityriasis; IGF biding protein; IGFBP-2; IGFBPB3; inflammation; psoriasis; pilatis; growth factor mediated cell proliferation; ichthyosis; serborrhoea; ruba;

```
The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an antisense oligonucleotide, (for Insulin-like Growth Factor [163]-1 receptor, [167 binding protein [16FBP]-2 or IGFBP3), which is capable of inhibiting or reducing prowth factor mediated cell proliferation.

In compared to the disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotide which can be used to design the antisense oligonucleotides of the present invention (see AAF45151 and AAF45153-154161). The method is useful for ameliorating the effects of psoriasis, cichthyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, nepplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic disease, kidney disease, hyperproliferation of the inside of blood custometric processes or any other hyperplasia
                                                                                                                                                                                                                                                                                                                                                                                                                                  Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or
keratosis; neoplasia; scleroderma; wart; skin cancer; sclerotic disease; hyperneovascular condition; hyperplasia; kidney disease; neovascular condition of the retina; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 15 BP; 0 A; 4 C; 7 G; 4 T; 0 U; 0 Other;

```
The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an antisense oligonucleotide, (for Insulin-like Growth Factor [GGP]-1 receptor, IGF binding protein [IGFBP]-2 or IGFBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the artisense oligonucleotide which can be used to design the artisense oligonucleotide is useful for ameliorating the effects of psoriasis, chthyosis, pityriasis, ruba, pilaris, serbornhoea, keloids, keratosis, neoplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, disease, kidhey disease, hyperproliferation of the inside of blood vessels or any other hyperplasia
                                                                                                                                                                                                                                                                                                                    Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or

The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an ancisence oilgonucleotide, (for Insulin-like Growth Factor [IGF] areceptor, ICF binding procein [IGFBP] 2 or IGFBPB), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotides of the present invention (see AAF45151 and AAF45153 oligonucleotides of the present invention (see AAF45151 and AAF45153 inthipyosis, pityriasis, ruba, pilaris, serborthoea, keloids, keratosis, incoplasias, scleroderma, warts, benign growths, cancers of the skin, a hypericons of see as a necvascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic disease, kinney disease, hyperproliferation of the inside of blood
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Antisense therapy; antiproliferative; antiinflammatory; antipsoriatic; cytostatic; dermatological; cardiant; virucide; ophthalmological; keloid; skin discorder; lisulin-like Growth Factor.                                                                                                                                                                                                                      Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                       skin disorders. The method comprises contacting the skin with an antisense oligonuclectide, (for Insulin-like Growth Factors [IGFF]-1 inhibiting or reducing protein [IGFF]-2 or IGFF], which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonuclectide which can be used to design the antisense oligonuclectide which can be used to design the antisense oligonuclectides of the present invention (see AMF45151 and AAF45153-F55161). The method is useful for ameliotrating the effects of postaais, inchthyosis, pityriasis, ruba, pitaris, serborthoea, keloids, keratosis, neoplasias, scleroderma, warts, benign growths, cancers of the skin, a pyperneovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic disease, kidney disease, hyperproliferation of the inside of blood
                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to a method for ameliorating the effects of

Example 7; Page 50; 201pp; English

The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an antisense oligonucleotide, (for Insulin-like Growth Factor [IGF]) receptor, IGF binding protein [IGFBB] - 2 or IGFBB), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotides of the present invention (see AAF4151 and AAF45153 - F45161). The method is useful for ameliorating the effects of psoriasis, inchipyosis, pityriasis, ruba, pliaris, serborrhoea, Keloids, Keratosis, hepplaaias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic disease, kidney disease, hyperproliferation of the inside of blood vessels or any other hyperplasia

skin disorders. The method comprises contacting the skin with an antisense oligonucleotide, (for Insulin-IRe Growth Factors [1989-1] receptor, IGF binding protein [IGFBP2] or IGFBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotide which can be used to design the antisense oligonucleotide of the present invention (see AAP45151 and AAP45153-15751.) The method is useful for ameliotrating the effects of psortasis, inchipyosis, pityriasis, ruba, planis, serborrhoea, keloids, keratosis, neoplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic disease, kidney disease, hyperproliferation of the inside of blood
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Seguence 15 BP; 8 A; 2 C; 2 G; 3 T; 0 U; 0 Other;

Novel polynuclectide comprising single nucleotide polymorphisms in human interleukin-13 gene is useful for studying expression and function of interleukin-13, as well as diagnosing and treating cancer, inflammatory, and immune disorders.

Claim 15; Page 20; 85pp; English.

The present invention provides the protein, cDNA and genomic sequences of human interleukin-13 [113], and describes the single nucleotide polymorphisms (SNPs) found within the gene, which is found on chromosome 5q31. ILI3 is a pro-inflammatory cytokine thought to be involved in the pathogenesis of asthma and other immune and inflammatory diseases. The ILI3 sequences and the SNPs identified can be used in drug screening, to determine an individual's susceptibility to disease, in forensic and paternity testing, and to identify treatments for cancer, immune and inflammatory diseases, including asthma and diseases characterised by fibrosis. The present sequence is an ILI3 allele-specific oligonucleotide

Claim 15; Page 22; 135pp; English.

The present invention describes polynuclectides comprising single nuclectide polynucphisms (SNPs) in the human dopamine receptor D2 (DRD2). The polynuclectides may be used in assays to detect and characterise polymorphisms in DRD2 that affect its expression and activity and are involved in disorders such as schizophrenia, Parkinson's and myoclonus dystonia (MD). This information would be useful for studying the biological function of DRD2 as well as in identifying drugs targeting this protein for the treatment of disorders related to its abnormal expression or function. Polymorphisms in the DRD2 gene affect the expression of active and functional polypeptides. Therefore it is advantageous to detect polymorphisms in the DRD2 gene affect the polymorphisms are combined in different copies of the gene. AAF70261 to AAF70308 represent human DRD2 allele specific oligonucleotide probes, and AAF70309 to AAF70404 represent human DRD2 allele specific oligonucleotide primers which are used in the detection of DRD2 polymorphisms. AAF70405 represent oligonucleotide primers for the detection of BRD2 polymorphisms. to AAF70452 represent oligonucleotide primers for the detection of human DRD2 polymorphisms which are given in the exemplification of the present invention. AAF70453 to AAF70538 represent PCR primers for the human DRD2 gene which are used in examples from the present invention

receptor-lipha gene (IL4R-alpha, see AAP57718 for the reference sequence). Polymucleotides comprising polymorphic gene variants are useful for therapeutic purposes. For example, where a patient may benefit from expression of a particular IL4Ralpha protein isoform, an expression vector encoding the isoform may be administered to the patient. It may desirable to decrease or block expression of a particular IL4Ralpha isogene, which may be done by turning off by transforming a targeted organ, tissue or cell population with an expression vector that expresses high levels of untranslatable mRNA for the isogene. Specific therapeutics identified by these methods may be useful for allergic diseases. The present sequence is a probe for human IL4R-alpha
                                                                                                                                                                                                                                                                                                                                                                                                                                     New isolated polynucleotide useful for the identification of therapeutics in allergic diseases is new.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to polymorphisms of the human interleukin 4
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human, neuroprotective, neotropic, gene therapy, vaccine,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to polymorphisms of the human interleukin 4 receptor-alpha gene (IL4R-alpha; see AAF57718 for the reference sequence). Polymucleotides comprising polymorphic gene variants are useful for therapeutic purposes. For example, where a patient may benefit from expression of a particular IL4Ralpha protein isoform, an expression of expression of a particular IL4Ralpha protein isoform, an expression desirable to decrease or block expression of a particular IL4Ralpha isogene, which may be done by turning off by transforming a targeted organ, tissue or cell population with an expression vector that expresses high levels of untranslatable mRMA for the isogene. Specific therapeutics identified by these methods may be useful for allergic diseases. The present sequence is a probe for human IL4R-alpha

The present invention relates to a method of coupling visual servoing microscopy with living cell analysis, where cellular image data received from a detection device that monitors cells or subcellular components of the cells, is analysed, and in response to the analysed cellular image data several stimulating devices adapted to stimulate the cells or subcellular components, is automatically actuated. The method is useful concarrying out cell-type specific fluorescence assays that are useful for any types of cells, and allows detection and discrimination between normal, premalignant, malignant and/or multidatus resistant cancer cells obtained from tissue, for establishing a chemotherapeutic regimen that is tailored to an individual patient and/or individual tumour and for screening large numbers of potential drug, insecticide, herbicide and stream expendence is an peptide nucleic acid (PNA) antisense sequence in medicine, agriculture and biotechnology. The present sequence is an peptide nucleic acid (PNA) antisense sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel polynucleotide containing polymorphisms in intercellular adhesion molecule 2 gene, useful in developing drugs for treating human
                                                                                                       Coupling visual servoing microscopy technique with living cell analysis involves analyzing image data received from detection device monitoring cells, and automatically actuating stimulating devices to stimulate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human, intercellular adhesion molecule 2; ICAM2; haplotyping; ss; haplotype pair; single nucleotide polymorphism, genotyping; PCR primer; gene therapy; drug screening; anti-HIV; antiinflammatory; probe; human immunodeficiency virus; sequencing primer.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to methods for the screening, diagnosis and prognosis of Alzheimer's disease. The methods involve the detection of Alzheimer's Disease-Associated Features (AFS) and Alzheimer's Disease-Associated Protein Isoforms (APIS) in cerebrospinal fluid, serum or Bassociated Protein Isoforms (APIS) in cerebrospinal fluid, serum or Expression Reference Protein Isoform (ERPY) in order to determine whether a patient is suffering from, or has a predisposition to, Alzheimer's severity of Alzheimer's bisease. The relative abundance of the AFS and APIS correlates with the severity of Alzheimer's bisease. The present sequence is a probe that may be used for screening an API
                                                                                                                                                                                                                                                                                                               Screening for Alzheimer's disease in a mammal, by making two-dimensional array of a feature whose relative abundance correlates with disease, and comparing with abundance of the feature in samples of healthy persons.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

The invention relates to single nucleotide polymorphisms in the gene encoding human intercellular adhesion molecule 2 (ICAM2). A method for haplotyping the ICAM2 gene in an individual comprises identifying the nucleotide at one or more polymorphic sites and determining whether one of the copies of the gene is defined by one of the ICAM2 haplotypes given in the specification or whether both copies are defined by a haplotype pair. This method is useful in genotyping, whereby all possible haplotype pair. This method is useful in genotypes. An association between a trait and a haplotype or haplotype pair of the haplotype or haplotype pair in a reference population, where a higher haplotype for haplotype pair in a reference population, where a higher haplotype or haplotype pair. IcAM2 and its corresponding DNA are used for studying the expression and function of ICAM2, for use in screening for studying the expression and function of ICAM2, for use in screening for studying the effect of variation on the biological activity of ICAM2. Sequences AAS95562-AAS95417 and AAS954419-AAS95442 represent allele-
specific calgonuclectide probes, sequencing primers and cDNA
immunodeficiency virus infection and inflammatory diseases.

Detecting detecting

mutations associated with anti-HIV drug resistance comprises at least one of the mutations in the HIV reverse transcriptase

The present invention describes a method for detecting mutations associated with anti-HIV drug resistance in a patient by detecting at least one of the mutations K103N/R, V106A/IL, X181C/I, M184V/I, X188L/I 0190A/S/R, T215Y/F/D/S/A and/or O151M/L in the reverse transcriptase (RT) of HIV strains in a biological sample using a specific set of probes of this of function together in a reverse-hybridisation assay. The method and the nucleic acid sequences used in the method are useful for determining viral mutations and/or polymorphisms in the HIV RT gene associated with resistance. The probes are useful for the genetic detection, preferably in vitro detection of the mutations K103N/R, V106A/IL, Y181C/I, Q151M/L, M184V/I, X188L, G190A/S/R and/or C151SY/FD/S/A in the RT of HIV strains in a biological sample, where the mutation is associated with anti-HIV drug resistance. The method provides a rapid, reliable and precise assay or determination and monitoring of a rapid, reliable and precise assay or determination and monitoring of a rapid, reliable sand precise assay or determination and monitoring of sequences and probes which are used in the exemplification of the present Detecting mutations associated with anti-HIV drug resistance comprises detecting at least one of the mutations in the HIV reverse transcriptase gene by using probes optimized to function together in a reverse-hybridization assay. as New human nucleic acid containing specific SAGE tags, useful diagnostic markers for cancer, also derived probes.

Disclosure, Col 31; 161pp, English.

The invention relates to an isolated, purified human nucleic acid (I) that has the same sequence as a mRNA found in humans and is a SAGE (serial analysis of gene expression) tag comprising a single stranded probe containing at least 10 consecutive nucleotides. SAGE tags, are diagnostic and prognostic markers of cancer, especially of the colon and pancreas. ABK31900-ABK32770 represent human colon and pancreatic cancer

```
The present invention relates to enzymatic nucleic acids which specifically cleave RNA derived from Hepatities C virus (HCV). The specifically cleave RNA derived from Hepatities C virus (HCV). The carrymatic nucleic acid or ribozyme is in a hammerhead (HH) or hairpin (HP) motif where the binding arms comprise sequences complementary to one of the substrate sequences defined in the specification. The HCV incorpars are useful for modulating the expression and/or replication of HCV. They can be used to treat cirrhosis, liver failure and/or hepatocellular carcinoma. The HCV ribozymes are also useful for treating a condition associated with HCV infection in conjunction with one or more other drug therapies, particularly type I interferon, especially interferon alpha, beta or gamma or consensus interferon. The present sequence represents a substrate for a HCV hammerhead (HH) ribozyme. Note: Some of the sequence data for this patent did not form part of the obtained in electronic format directly from the USPTO web site at sequence sequence data for this patent was obtained in electronic format directly from the USPTO web site at

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to enzymatic nucleic acids which specifically cleave RNA derived from Hepatitis C virus (HCV). The enzymatic nucleic acid our ribozyme is in a hammerhead (HH) or hairpin of the substrate sequences defined in the specification. The HCV of the substrate sequences defined in the specification. The HCV ribozymes are useful for modulating the expression and/or replication of HCV. They can be used to treat cirrhosis, liver failure and/or hepatocellular carcinoma. The HCV ribozymes are also useful for treating a condition associated with HCV infection in conjunction with one or more other drug theraspies, particularly type I interferon, especially interferon alpha, beta or gamma or consensus interferon. The present sequence represents a substrate for a HCV hammerhead (HH) ribozyme. Note: Some of the sequence dar for this patent did not form part of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New ribozymes targeting RNA derived from hepatitis C virus inhibit viral replication and are useful to treat hepatitis C virus infections and cirrhosis, liver failure or hepatocellular carcinoma.
                                                                                                                                                                                                                                                                                                                                                                                                          Enzymatic nucleic acid, RNA cleavage, Hepatitis C virus infection, HCV ribozyme, HCV expression, HCV replication, cirrhosis, virucide, liver failure, hepatocellular carcinoma, HCV infection, drug therapy, type I interferon, interferon alpha, interferon beta, cytostatic, interferon gamma, consensus interferon, hepatotropic, autiinflammatory, substrate, hammerhead ribozyme, HH ribozyme, ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 printed specification. The present invention relates to enzymatic nucleic acids which specifically cleave RNA derived from Hepatitis C virus (HCV). The enzymatic nucleic acid or ribozyme is in a hammerhead (HH) or hairpin (HP) motif where the binding arms comprise sequences complementary to one of the substrate sequences defined in the specification. The HCV ribozymes are useful for modulating the expression and/or replication of HCV. They can be used to treat cirrhosis, liver failure and/or replication of hepatocellular carcinoma. The HCV intozymes are also useful for treating a condition associated with HCV infection in conjunction with one or more other drug therapies, particularly type I interferon, especially interferon alpha, beta or gamma or consensus interferon. The present sequence date for a HCV hammerhead (HH) ribozyme. Note: Some of the sequence date for this patent did not form part of the printed specification. The complete sequence data for this patent was obtained in electronic format directly from the USPTO web site at
New ribozymes targeting RNA derived from hepatitis C virus inhibit viral replication and are useful to treat hepatitis C virus infections and cirrhosis, liver failure or hepatocellular carcinoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    0.5%; Score 11.8; DB 1; Length 15; 86.7%; Pred. The enzymatic nucleic acid or inbozyme is in a harmerhead (HH) or hairpin (HP) motif where the binding arms comprise sequences complementary to one of the substrate sequences defined in the specification. The HCV ribozymes are useful for modulating the expression and/or replication of HCV. They can be used to treat cirrhosis, liver failure and/or replication accolular carcinoma. The HCV infection in conjunction with one or more condition associated with HCV infection in conjunction with one or more a condition associated with HCV infection in conjunction with one or more other any therapies, particularly type I interferon. The present sequence data for this patent did not form part of the printed sequence data for this patent did not form part of the printed specification. The complete sequence data for this patent was obtained in electronic format directly from the USPTO web site at sequence can be complete sequence data for this patent was obtained in electronic format directly from the USPTO web site at

The invention relates to reading microarray devices having addressable electrodes to determine binding between capture probe and target molecule (TM) The method involves providing an array having electrodes and capture molecules, attaching an oxidation/reduction enzymatic moiety to TM to create a prepped target sample (1), administering (1) to the array, adding a substrate to array to create a voltage, and measuring the voltage. The method is useful for reading microarray devices having a daressable electrodes to determine the binding between a capture probe and a target molecule, where the target molecule is selected from DNA, RNA, single-stranded DNA, Thosomal RNA, mitcohndrial DNA, cellular receptors, glycosylated membrane bound proteins, non-glycosylated membrane bound proteins, non-glycosylated membrane bound proteins, nolypeptides, antibodies, cellular antigenic determinants, organic molecules, metalions, salt anions and cations, and their combinations. The present sequence represents a Kras sequence used to exemplify an oligonucleotide hybridization electrochemical detection
                                                                                                                                                                                                                                                                                  Microarray device; electrode; oxidation; reduction; Kras; hybridization;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Assaying binding of target and capture molecules on microarray devices, by providing an array having electrodes and capture molecules, and enzymatically catalyzing oxidation/reduction reaction to detect current
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

The present invention relates to methods for screening or diagnosing Alzheimer's disease (AD) to determine the stage or severity of AD in a subject, to identify subject at risk of developing AD, or to monitor the effect of therapy administered. The methods comprise analysing a test sample of body fluid by 2-dimensional electrophoresis to generate a 2-dimensional array of AD-associated features (AFs). The method alternatively comprises quantitatively detecting in a sample of body fluid from the subject, one or more AD-associated protein isoforms (APIs, ABRS9110-ABRS9184). The present sequence is a probe, used to illustrate
                                                                                                                                                                                                                                                                                                                                                                                                                                    Screening or diagnosing of Alzheimer's disease (AD) determine the stage or severity of AD in a subject, comprises analyzing a test sample of body fluid from the subject by 2-dimensional electrophoresis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention describes a modified Cry protein (I) that is sensitive to pepsin and comprises at least one additional pepsin cleavage setsitive to pepsin and comprises at least one additional pepsin cleavage setsitive (PCS). Also described: (a) increasing pepsin sensitivity of cry proteins by incorporating at least one extra PCS; (b) polynucleotides (II) that encode (I); (c) chimaric genes (CG) that contain a promoter, (II) and terminator; (d) expression or transformation vector (III) that contains CG; (e) host organism (IV) transformed with (III), also, where the organism is a plant, its parts and seeds; (f) production of (I) by grains (I). (I) has insecticide activity. (I) can be used as insecticides, particularly where expressed in transgenic plants. (I) are sensitive to enzymes in the digestive tract of mammals, so do not persist in the tract (lack of persistence is required by regulatory authorities for use, in foods, of seeds containing Cry proteins). Extra PCS do not insecticidal activity. ABV93460 to ABV93999 and ABB63997 to ABB68308 represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New modified Cry protein, useful as insecticide, comprises at least one additional pepsin cleavage site to reduce persistence in mammalian gut.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Alzheimer's Disease-associated protein isoform, API, probe, SEQ ID 472.

The invention describes a method use for treating increased rate of proliferation of a cell or extending the ability of a cell to replicate, or treating a disease associated with cell senescence. The method comprises administering an agent to reduce loss of telomere length within the senescing cells. The method is useful for treating a condition associated with an increased rate of proliferation of a cell extending the ability of a cell to replicate, or for treating a cell extending the ability of a cell to replicate, or for treating a disease or condition associated with cell senescence e.g. neoplasia. A second method disclosed in the invention is useful for treating a condition associated with an elevated level of telomerase activity within a cell e.g. cancer. Also disclosed is method useful for diagnosis of a condition associated with an increased rate of proliferation in a cell in an individual e.g. age-related macular degeneration, astrocytes associated with Alzheimer's discloses and endothelial cells associated with atherosclerosis. This sequence represents a polynucleotide used in the study of telomere length
                                                                                                                                                                 Treating condition associated with cell senescence or increased rate of cell proliferation, by administering to cell an agent that derepresses telomerase in the senescing cells or that reduces loss of telomere
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Cell proliferation; cell senescence; telomere length; telomerase activity; cel replication; neoplasia; cancer; age-related macular degeneration; Alzheimer's disease; atherosclerosis; telomerase; telomerase inhibitor; immortalised cell; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Telomere length and/or telomerase activity related polynucleotide #63.

The invention describes a method use for treating increased rate of proliferation of a cell or extending the ability of a cell to replicate, or treating a disease associated with cell senescence. The method comprises administering an agent to reduce loss of telomers length within comprises administering an agent to reduce loss of telomers length within associated with an increased rate of proliferation of a cell extending the ability of a cell to replicate, or for treating a condition associated with an increased rate of proliferation of a cell extending the ability of a cell to replicate, or for treating a disease or condition associated with cell senescence e.g. neoplasia. A second method disclosed in the invention is useful for treating a condition associated with an increased rate of proliferation in a cell in an individual e.g. with an increased rate of proliferation in a cell in an individual e.g. cape-related macular degeneration, astrocytes associated with Alzheimer's disease and endothelial cells associated with atherosclerosis. This cape activity described in the invention
                                                                                                                                                       Treating condition associated with cell senescence or increased rate of cell proliferation, by administering to cell an agent that derepresses telomerase in the senescing cells or that reduces loss of telomere
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Microarray, capture probe molecule, target molecule, electrode; oxidation/reduction enzymatic moiety, voltage signal; porous reaction layer; polymeric; lateral signal; laccase; horseradish peroxidase; beta-galactosidase; glucose oxidase; alkaline phosphatase; dehydrogenase; biotin; streptavidin; ss.

The invention discloses a method for reading microarray devices having addressable electrodes to determine binding between a capture probe addressable electrodes to determine binding between a capture probe molecule (CM) and a target molecule. The method comprises providing an molecule (CM) and a target molecule. The method comprises providing an corresponding to the electrodes, non-specifically attaching an corresponding to the electrodes, non-specifically attaching an ample for analysis to create a propped target sample, administering the prespect target sample to the atray and allowing for binding of the target molecule to CM, adding a substrate to the array that will create a local voltage signal when catalysed by the oxidation/reduction enzyme through local generation of electrochemical reagents at each electrode having a capture molecule trached to it. The array further comprises a porous reaction layer, made trached to it. The array further comprises a porous reaction layer has a cativity products such that there is little lateral signal reduction activity products such that there is little lateral signal reduction activity products such that there is little lateral signal complications and is attached to the exaget molecule is combinations, and is attached to the target molecule is combinations, and is attached to the target molecule is combinations, and is attached to the target molecule is combinations and is attached to the target molecule is combination of properties, polypeptides, polypeptides, antibody combination or the carget molecule is especially a DNA, man, single-extraded DNA, ribosomal combinatity of the above mentioned molecules. The method is useful for the target molecule of the above mentioned molecules. The method is useful for plurality of the above mentioned molecules. The method is useful for plurality of the above mentioned molecules, material ones, salt anions, cations or their combinations. The sequence presented is the krast target collecules. The inventions or their combination
                                                                                                   Reading a microarray devices comprises providing an array, attaching an oxidation/reduction enzyme to a target molecule, applying the target molecule and an enzyme substrate to the array, and measuring a voltage

Triplex forming oligonucleotide directed against Erb-B2 gene. (revised)
(first entry) 25-MAR-2003 15-MAR-1995

Exb-B2, upstream region; regulatory element; gene expression; triplex; antisense; inhibition; screening; identification; cancer; breast cancer; carcinoma; breast cancer; erythroleukaemia; sarcoma; ss.

3ynthetic.

The Erb-B2 gene has a purine rich segment with substantial mirror symmetry. This sequence, derived from the Erb-B2 gene is located 69 mucleotides upstream of the transcriptional start site and is the potential site of H-DNA formation. The overexpression of Erb-B2 is particularly associated with breast cancer. This triplex forming oil ground-lockide directed against Erb-B2 and its derivatives may be used in the treatment of breast cancer, erythroleukaemia and sarcoma and more generally any disease involving the expression of Erb-B2. (Updated on 25-Gaps ; 0 Composition for decreasing gene transcription - comprises oligo:nucleotide or deriv. complementary to target gene region 0.5%; Score 11.8; DB 1; Length 16; 16.7%; Pred. converting enzyme) gene, and can be used in the method of the invention.

The method is for assessing cardiovascular status in humans by
The method is for assessing cardiovascular status in humans by
Getermining the sequence of at least one polymorphic site in the ACE
(angiotensin converting enzyme), AGT (angiotensinogen) and/or ATI (type I
cangiotensin II receptor) genes, and comparing the polymorphic pattern
with that in patients with predetermined markers of status. The method is
cused to assess blood pressure or electrocardiographic profile, to
diagnose a cardiac condition such as (silent) myocardial infarction (MI),
hypertension, atherosclerosis or stroke. They can also be used to predict
cresponse to treatments with ACE inhibitors, angiotensin II receptor
antagonists, diuretics, alpha- or beta-adrenergic receptor antagonists,
ct. It is also used to identify susceptibility to cardiovascular
cdisease. Libraries of nucleic acids containing polymorphic positions in
the 3 genes, and libraries of targets corresponding to the peptides from
the genes are used to screen for cardiovascular agents. The nucleic acids
the genes are used to be used as source of probes
                                                                                                                                                       Assessing cardiovascular status in humans by polymorphic analysis - of genes for angiotensin converting enzyme, angiotensinogen and angiotensin II receptor, used to diagnose predisposition to disease and to predict effect of therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

This invention describes a novel method for identifying organisms by comparative genetic analysis which comprises polymerase chain reaction (PCR) amplification and subsequent genotyping and analysis of coding and/or non-coding regions, and/or functionally significant regions of highly conserved genes and/or their homologs, and/or their coDNA copies and/or their pseudogenes. The method is used for identifying animals and plants and their relatedness (phylogenetic analysis) and identifying provides rapid, simple and reproducible determination of the sequence provides rapid, simple and reproducible determination of the sequence within a selected gene region. It amplifies sequences from a wade variety of species, producing an amplicon that includes a region with high divergence between species. Since the region amplified is relatively small, even badly degraded DNA can be analysed
                                                                                                                             ig organisms by comparative genetic analysis, useful e.g. in forensic testing, comprises genotyping regions of highly
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Angiotensin-converting enzyme gene; ACE; polymorphism; polymorphic marker; cardiovascular disease; myocardial infarction; unstable angina; hypertension; atherosclerosis; stroke; prognosis; drug screening; treatment outcome; human; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human angiotensin-converting enzyme (ACE) PCR primer, SEQ ID NO:9.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This invention describes a novel method for identifying organisms by comparative genetic analysis which comprises polymerase chain reaction (PCR) amplification and subsequent genotyping and analysis of coding and/or non-coding regions, and/or functionally significant regions of highly conserved genes and/or their homologs, and/or their conserved genes and/or their homologs, and/or their collections. The method is used for identifying animals and plants and their relatedness (phylogenetic analysis) and identifying tissue or blood samples, or foods, e.g. in forensic tests. The method provides rapid, simple and reproducible determination of the sequence within a selected gene region. It amplifies sequences from a wide variety of species, producing an amplicon that includes a region with high divergence between species. Since the region amplified is relatively small, even badly degraded DNA can be analysed
                                                                                                                                                                                                                                                                                                                                                                                  Identifying organisms by comparative genetic analysis, useful e.g. in foods and forensic testing, comprises genotyping regions of highly

The invention relates to a novel method of assessing the cardiovascular cartains in an individual and to newly identified polymorphisms in the genes encoding angiotensin-converting enzyme (ACE) angiotensin in the additional and type 2 (ATE), angiotensinged (ACE), renin, addosterone synthase, endothelin receptor type A and beta-adrenergic receptors 1 and 2. The method comprises determining the sequence at one pattern of polymorphisms from the individual with a reference polymorphic positions within these genes, and comparing the pattern obtained from a population of individual exhibiting a predetermined cardiovascular disease status. The polymorphic markers are useful for determining the preddisposition of an individual to articovascular disorders such as myocardial infarction, unstable angina, predetermined cardiovascular status of a patient given a predicting the likely cardiovascular status of a patient given a predicting the likely cardiovascular status of a patient regimen comprising administration of cardiovascular days blockers) or calcium channel blockers). One or more polymorphic markers in predicting the likely cardiovascular status of a patient sequence of a treatment regimen. The proof of a treatment regimen. The proof of a treatment regimen of the genes comprising administration of a patient given a protocins of the genes comprising a polymorphic site may be used as blockers for high throughpur screening. The polymorphic markers in molecular cardiovascular patient. It also provides the ability to library arrays for high throughpur screening. The polymorphic patient for a particular cardiovascular patient. It also provides the ability to a liminates trial and error in adverse response, to a particular captured with a sub-populations from the readment group. Beneficial cardiovascular patient sequence response, to a particular correlated with a sub-populations from the treatment group. Beneficial correlated with a sub-populations from the readment sequences of patients required for a calininate propula

The present invention describes a method for distinguishing a human leukocyte antigen (HLA) class I antigen or allele by a combination of polymerase chain reaction (PCR) using a primer pair whereby all HLA-A, -B or -C alleles can be amplified or using reverse hybridisation analysis comprising a DNA probe covalently bonded to microtitre plate wells which are hybridisable specifically with the base sequence of at least one specific HLA-A, -B or -C allele. The method is applicable in gene typing, judging donor-recipient compatibility during organ transplant and correlation analysis for diagnosis of various diseases. The method is simple, rapid and accurate, with possibility of mechanisation and automation, without the problems encountered by using the prior-art techniques. AAA66943 to AAA67072 represent oligonucleotide probes and PCR primers for use in the method of the present invention
                                                                                                                                                                            Simple, rapid and accurate method for distinguishing HLA class I allele type with possibility of mechanization and automation, applicable in judging donor-recipient compatibility during organ transplant and disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

                                                                                  The present invention is related to methods for determining the polymorphic pattern of an individual and using the results to determine their risk of a number of diseases, including cancer, cardiovascular diseases, glaucoma and nervous system disorders such as depression and neurodegenerative diseases. In addition, the methods can be used to determine the effects of different types of treatment for individuals, and thus enables appropriate therapies to be prescribed. THe PCR primers shown in sequences AAG61201-C61371 were all used to demonstrate the

The invention relates to a non-naturally occurring gene therapy vector, comprising an inner shell having a core complex containing a nucleic acid and at least one complex forming reagent. The vectors are stable having an improved outer steric layer that provides enhanced target specificity. In vivo and colloidal stability. The vectors are relatively homogeneous and comprise chemically defined species. The vectors demonstrate improved cell entry and intracellular trafficking, permitting enhanced nucleic acid therapeutic activity such as gene expression. The present sequence is that of a peptide nucleic acid for preparation of a NLS moiety coupled nucleic acid. The present sequence is linked to the SV40 large T-antigen NLS sequence (AAM51435)
                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                              Non-naturally occurring gene therapy vector useful for gene therapy, comprises an inner shell having a core complex containing a nucleic acid and at least one complex forming reagent.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Determining sequence variation in, or monitoring expression of genes in target nucleic acid for high-throughput genotyping of (un)known polymorphisms/mutations, comprises hybridization pattern differences between target and probe sequences.

```
The invention relates to a method of simultaneously determining the presence of 2 or more sequence variations in target nucleic acids, or simultaneously monitoring expression of 2 or more genes. The method comprises determining differences in hybridisation between the target nucleic acid and immobilised probes, where differences in hybridisation between the target nucleic acid and immobilised probes, where differences in hybridisation between indicates sequence variations or transcription levels. The method is used for simultaneously determining the presence or absence of two or more sequence variations in target nucleic acids or simultaneously more sequence variations in target nucleic acids or simultaneously more participated of the complex of two or more genes in target nucleic acids. The method are applicable to high-throughput genotyping of known and unknown polymorphisms and mutations. The method maximises the information yield of hybridisation-based array applications by increasing the number of informative array-immobilised polymucleotide probes. The present sequence represents N-acetyltransferase 2 (NAT2) G191A single nucleotide probes.

Isolated nucleic acid molecule encoding a P-glycoprotein of rhesus monkey, useful in assays for evaluating bioavailability of drugs, as well as for the optimization or discovery of drugs.

Example 1, Page 40; 103pp; English.

The invention comprises the amino acid and coding sequence of a rhesus mankey (Macaca mulatted P-glycoprotein and related P-glycoproteins. The DNA and protein sequences of the invention are useful in assays for evaluating the bioavailability of drugs, as well as the optimisation or discovery of drugs for the treament of discovery of drugs for the treament of discovery as secondated with P-glycoprotein transporter activity. The present DNA sequence represents part of the gene encoding the Rhesus monkey P-glycoprotein

the scope of the invention

```
This invention relates to a novel isolated nucleic acid, gene 216, identified from human chromosome 20p13-p12. The invention also discloses regions of the 216 gene that contain single nucleotide polymorphisms (SNP's) which may be used as markers for disease susceptibility or severity. The nucleotides of the invention may have antiasthmatic, antinflammatory or anorectic activities and may be used in gene therapy. The nucleic acids, antibodies or its fragments are used in gene therapy. The nucleic acids, antibodies or its fragments are used in gene therapy. Deventing or treating a disorder, such as respiratory diseases (e.g. asthma, bronchial hyper-responsiveness, chronic obstructive pilmonary disease or adult respiratory distress syndrome), obserity, or inflammatory bowel syndrome. The nucleic acids are also useful for identifying increased susceptibility of a subject to the disorders mentioned. The nucleic acids can also be used as primers and templates for the recombinant production of disorder-associated peptides or polypeptides, for chromosome and gene mapping, or for tissue distribution studies. The present sequence represents a gene 216 specific oligonucleotide probe

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to treating viral infection or reactivation comprising contacting an individual with an antagonist of the interaction between a Herpes Simplex viras (HSV) polymorlectide appearing as ADD07153 and interferon regulatory factor—1 (TRF—1, a transcription factor of the interferon regulatory factor—1 (TRF—1, a transcription isolated HSV polymorlectide comprising ADD07153, a composition comprising a HSV polymorlectide comprising ADD07153, a composition comprising of compounds capable of inhibiting specific binding of IRF—1 to a polymorlectide, screening for compounds capable of inhibiting specific binding of IRF—1 to IRF—1:IRF—BP (Undefined) complex, a compound capable of agonising or antagonishing any compound in IRF—1 and/or interferon of agonishing or antagonishing any compound in IRF—1 and/or interferon binding site consensus sequence. The method is useful for treating infection or reactivation caused by Herpes virus, e.g., HSV-1 or HSV-2 infections and for cytomegallovirus, Espetein Sarr virus and soster virus infections. The HSV polymeptide and polymorlectides may also be useful at the HSV polymeptide and polymorlectides may also be useful at the HSV polymeptide and polymorlectides may also be useful at the HSV polymeptide and polymorlectides may also be useful at the HSV polymeptide and polymorlectides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Treating infection or reactivation caused by Herpes virus comprises using antagonist of Herpes Simplex virus polynucleotide sequence and interferon regulatory factor-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

The present invention relates to a method (M1) for determining a predisposition for or the occurrence of neurodegenerative disease in a predisposition for or the occurrence of neurodegenerative disease in a subject. The method comprises detecting in a target nucleic acid obtained from the subject the presence or absence of an allelic variant of one or more polymorphic regions of one or more genes selected from upA (Urokhase plasminogen activator), SNCG (gamma-synuclen), IDE (insulinderading enzyme), KNSL1 (Kinesin-like protein 1), LIPA (1900smal acid 19pase), and TNFRSF6 (Tumour Necrosis Pactor Receptor-SP6), where the presence of at least one of the allelic variant of one or more polymorphic regions is indicative of a predisposition for or the cocurrence of neurodegenerative disease. The genes are all located on chromosome 10. M1 is useful for determining a predisposition for or the cocurrence of, and for treating neurodegenerative disease, particularly alzhahmer's disease. The present sequence is a PCR primer, which was used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

fragments of at least 15 consecutive nucleotides sequences, fragments of at least 15 consecutive nucleotides of these nucleotides, a sequence having at least 80% identity, after optimal alignment, with the nucleotides, or the complement, or corresponding RNA, of the nucleotides. The nucleotides are used as probes or primers for detecting, identifying quantifying and/or amplifying nucleic acids, as in vitro sense and antisense sequences, of nucleotides involved in tumour suppression or reversion, apoptosis and or viral resistance, to produce recombinant polypeptides, and to prepare transgenic animals, as experimental models. The nucleotides (also vectors containing them and cells containing the vectors), the encoded polypeptides and antibodies (the nucleotides (also vectors containing the mand any or sequence).

(Ab) against the polypeptide are useful for prevention and/or treatment of viral infections or diseases characterized by development of tumours or cell degeneration (e.g. Alzheimer's disease or schizophrenia).

Analysis of the expression of the nucleotides can be used for diagnosis and/or prognosis of these diseases. The nucleotides and polypeptides can also be used to screen for their specific interactive molecules, containing the mandor their specific interactive molecules.

The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-1 can be used as probes to detect, characterise and quantify and vaccine production. The hGDMLP-1 nucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements, and for provide initial substrates for the recombinant engineering of hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP and/or amount specifically of hGDMLP-1 proteins, as specific biomolecule and/or amount specifically of hGDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser describing the concentration and/or amount supplement in patients having specific deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The production and and skeletal muscle disorders hGDMLP-1 may be used for diagnosing a disorder sequence represents an oligomer used in the screening of the horsent captured for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO captures.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins, or as specific biomolecule capture probes for surface-enhanced laser desorption ionization, comprises human myosin-11ke protein hGDMLP-1.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             proteins and their coding sequences: MD24, MD24, MD212, MD23 is proteins and their coding sequences: MD24, MD24, MD27, MD212. MD23 is encoded at chromosome 7q22.1, MD24 is encoded at chromosome 6p21.3-22.2, MD27 is encoded at chromosome 15q26.1. The MD23, MD24, MD21, and MD212 is encoded at chromosome 15q26.1. The MD23, MD24, MD21, and MD212 sequences are useful in therapy, or in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MD23, MD24, MD27, or MD212, e.g. cancer or developmental disorders. The nucleic acused by altered expression of MD23, MD24, MD27, or MD212. The nucleic acids can also be used as probes to detect and characterize gross alterations in MD23, MD27, or MD212 genetic locus. The probes are useful in constructing microarrays for measuring gene expression. The proteins are useful as therapeutic agents for gene therapy or as vaccines. The present sequence was used to illustrate the invention.
                                                                                                                                                                                                                                                                                              Cytostatic; immunostimulant; gene therapy; vaccine; human; zinc finger protein; MDZ3; MDZ7; MDZ1; chromosome 7q22.1; chromosome 6p21.3-22.2; chromosome 16p11.2; chromosome 15q26.1; cancer; developmental disorder; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New zinc finger-containing proteins and nucleic acids, useful in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MDZ3, MDZ4, MDZ7 or MDZ12, e.g. cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                present invention relates to novel human zinc finger-containing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ;

The invention relates to a novel isolated 17 mer nucleic acid sequence, containing at least 15 consecutive nucleotides from the 17 mer sequence with, after optimal nucleotides from the 17 mer sequence with, after optimal nucleotides from the 17 mer sequence, a sequence that nucleic sequence that nucleic as the corresponding RNA. The novel isolated nucleic of any of them, or the corresponding RNA. The novel isolated nucleic acids of the invention are useful as probes and primers for detecting, identifying and/or amplifying a nucleic acid, e.g. as one component of a gene chip, in vitro as (anti) sense reagents, and for production of recombinant polypeptides. Any of the nucleic acids, polypeptides, vectors containing the nucleic acids, cells containing the vector or antibodies directed against the polypeptides are useful for preparation of pharmaceuticials for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell diseases that are characterised by development of tumours or cell diseases that an analysis of the expression of the 17 mer nucleic acids in patient samples is useful for disagnosis and/or prognosis of these content samples is useful for disagnosis and/or prognosis of these chosen the polypeptides can also be used to generate antibodies and choice content an uncleic acid sequences of the invention can be used in gene therapy. This polynucleotide sequence represents a tumour suppression can be used human fukutin oligomucleotide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                          Cytostatic, virucide, neuroprotective, nootropic, neuroleptic, gene chip, antisense, sense, tumour, cell degeneration, cancer, Alzheimer's disease; schizophrenia, protein chip, gene therapy, tumour suppression, human fukutin, ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies and transfected cells.

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligomucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, ardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99989, ABF00010-ABF99989, ABF00010-ABF99989 and ABI00010-ABF82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but the wipo int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.
                                                                                                                                                                             Set of oligonucleotides, useful for diagnosis and cell typing, is designed to detect single-nucleotide polymorphisms and cytosine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Set of oligonucleotides, useful for diagnosis and cell typing, i designed to detect single-nucleotide polymorphisms and cytosine methylation status.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ..
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         AAV10702-V10719 are primers used in a method to identify the novel human becast cancer gene CHI-25 by differential display. The identified genes or fragments of these genes can be used for identifying genes and gene products that are intimately related to malignant transformation or maintenance of the malignant properties of cancer cells. It can also be used to design or screen dispnostic reagents or therapeutic compounds. Kits are included within the scope of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This invention describes novel oligonuclectide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonuclectides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC99989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This invention describes novel oligonuclectide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonuclectides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, ardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at

This sequence represents a PCR primer for the FWR1 gene. This sequence was used to amplify Fragile XA related alleles from the FWR1 gene. The invention relates to a method for characterising a GC rich region of a nucleic acid comprising contacting the nucleic acid with an agent that modifies C or G into residues complementary to A or T, amplifying (at least part of) the resultant modified nucleic acid, and determining the size of the amplification product. The methods and kits for carrying the the methods are useful for characterising GC rich nucleic acids. This is particularly useful for characterising GC rich nucleic acids. This is particularly useful for diagnosing trinuclectide repeats associated with regions (FRAXB), spinal and bulbar muscular arrophy (SMBA), myotonic dystrophy (DM), Huntington's disease (HD), spinal and contaction (FRAXB-MR) and dentactular pallidoluysian atrophy (DRAXB-MR). Current methods of nucleic acid sequencing are hampered by the formation of stable secondary structures in GC rich regions which hamper the sequential incorporation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Characterizing GC rich regions of a nucleic acid comprising modifying GC residues into residues complementary to A or T, and amplifying the modified product, useful for diagnosing trinucleotide repeats.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to novel single nucleotide polymorphisms (SNPs) in the human Ran GTPase activating protein 1 (RANGAP1) gene flocated on chromosome 20413.2-413.4, and methods for haplotyping and/or genotyping the RANGAP1 gene. The methods of the invention make use of allele-specific oligonucleotides (ASOs) as probes and primers and/or polymorphisms. The polymucleotides for detecting the RANGAP1 gene treatment of diseases associated with RANGAP1 activity, such as cancer and other disorders associated with an irregular cell cycle. AAS19704-AAS19742 represent ASO probes for detecting human RANGAP1 gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                PCR primer; FWR1 gene; fragile XA related allele; GC rich region; FRAXA; diagnosis; trinucleotide repeat; Fragile XA syndrome; FRAXE-MR; SMBA; spinal and bulbar muscular atrophy; myotonic dystrophy; DRAPLA; SCAl;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Genotyping human Ran GTPase activating protein 1 gene of individual for determining haplotype of individual, involves determining identity of nucleotide pair at specific polymorphic sites for two copies of the gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

control profileration of endometrial strong, by expressing 11AZI polypeptide. The methods of the invention can be used to identify a compound which conclusion of endometrial strong, by expressing 11AZ in the presence of the compound, and determining whether the compound affects expression of jiAZ. jAZFI, jjAZI or jAZFI/jjAZI polypeptides are useful as mimunogens or antigens to raise or test anti-jAZFI or as immunogens or antigens to raise or test anti-jAZFI jiAZI or two hybrid assay or three hybrid assay to identify other proteins in a two hybrid assay or three hybrid assay to identify other proteins which bind or interact with jAZFI/jjAZI-binding proteins, jAZFI, jjAZI or cas tumour marker protein to verify that a stromal tumour is from endometrium. The antibody is useful for identifying the origin of tumour and compension, and also for treating endometrial stromal tumours. The present nucleic acid sequence represents a PCR primer that was used in the the mann jAZFI gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            A novel fusion protein comprises 2 dimer forming co-expressed amino acid sequences, each consisting of a homodimeric or heterodimeric receptor chain or ligand, with ligand-receptor binding activity, bound directly or via a peptide linker to a subunit of a heterodimeric protein hormone capable of forming a heterodimer with the hormone's other subunits. The fusion protein, e.g. the thrombopoietin (PPO) human chorionic gonadotrophin (hCG) fusion protein encoded by the fusion gene amplified by the present sequence, significantly increases the biological activity of the hormone component, reducing the requirement for hormone itself and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Fusion protein, thrombopoietin, TPO, human chorionic gonadotrophin, hCG;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    0
                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to growth hormone 1 (GH-1) gene including single mucleotide polymorphisms (SNP). The GH-1 diagnostic polymucleotide is useful as markers for the analysis of a disease, of susceptibility to drug treatment for GH-1 dysfunction or other diseases, or may be included in any complete or partial genetic map of the human genome. GH-1 mutant polypeptides are useful as antagonists of GH-1 hormone action. Polymucleotides encoding these polypeptides are useful in gene therapy. The present sequence is a PCR primer used for amplifying human GH-1 gene
                                                                                                                                                                                                                                                 New growth hormone 1 (GH-1) diagnostic polynucleotide, useful as markers for the analysis of a disease, or of susceptibility to drug treatment for GH-1 dysfunction or other diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human, jAZF1, juxtaposed with another zinc finger, jjAZ1, jAZF1/jjAZ1, joined with jAZF1, proliferation, endometrial stroma tumour, immunogen, antigen, antibody, fertility, pregnancy, gene therapy, vaccine, PCR;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel jAZF1, jjAZ1 or jAZF1/jjAZ1 polypeptides useful as immunogens or antigens to raise or test anti-jAZF1, jjAZ1 or jAZF1/jjAZ1 antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to a new jAZF1 (juxtaposed with another

course of the invention for the multimerisation of minimal motifs. The invention provides a method for increasing the resistance of a core protein to proteint or protein to protein to protein a stabilising polypeptide of formula or into the core protein a stabilising polypeptide of formula on to into the core protein a stabilising polypeptide of formula or into the core protein a stabilising polypeptide of formula on the core protein a stabilising polypeptide of formula on the part of the core protein of the invention are 1-6 sequential Gly residues and X, Y, Z are Ala, Ser, Val, Ile, Leu, Met, Phe, Pro or Thr and nean be anything between 1-66. X, Y and Z need not be identical from nepeat to repeat Alternatively a nucleic acid encoding a stabilising polypeptide can be linked onto or inserted into a nucleic acid encoding polypeptide can be linked onto or inserted into a nucleic acid encoding a core protein. The fusion proteins of the invention are more resistant to degradation by proteases and, thus, have a longer half-life than the unfused core protein. The products can be used for treating autoimmune an IkappaB regulator protein for the treatment of inflammatory bowel disease, or a nitroreductase protein which can activate nitro drugs in canyae/producy bherapy to treat cancer or other pathological conditions. The fusion proteins can also be used in diagnostic methods such as in vivo imaging. (Updated on 27-AUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New fusion proteins resistant to proteolytic degradation - comprising a core protein with a stabilising polypeptide comprising a peptide sequence containing glycine repeats.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Fusion protein; stabilising polypeptide; proteolytic degradation; resistance; half-life; autoimmune disease; inflammation; nitro drug; lkappas regulator protein; inflammatory bowel disease; in vivo imaging; nitroreductase protein; enzyme therapy; prodrug therapy; protease; cancer; pathological condition; minimal motif; PCR primer; ss.

The products of the invention have anti-inflammatory and antimalarial activity. (I) and (Ia) are used (I) to treat diseases in which TNF is involved (e.g. septic shock, autoimmune glomerulonephritis, cerebral malaria, immune responses and inflammation), (Ii) to purify TNF, (iii) to identify TNF (ant) agonists and (iv) for diagnostic determination of TNF in body fluids. Antibodies raised against (I) are used for affinity purification of (I). This sequence represents a PCR primer used in the amplification of the TNF binding protein of the invention. This invention describes novel insoluble proteins (1), also their (in) soluble fragments and pharmaceutically acceptable salts, able to bind tumor necrosis factor (TNF) and in homogeneous form. The products of the invention have antiinflammatory, immunosuppressive, antibacterial, antiprotozoal activity. (1), and related recombinant proteins, are used set in the diseases mediated by TNF, e.g. shock in cases of meningococcal sepsis, development of autoimmune glomerulonephritis and cerebral malaria. Also (1), or antibodies specific for them, are used for diagnostic determination of TNF in body fluids, for affinity purification of TNF and for identifying (ant) agonists of TNF. This sequence represents a PCR primer used in the amplification of the human 55 kD TNFRPP described in the method of the invention
                                                                                                                                                                                                                                 TNF; tumor necrosis factor binding protein; TNFBP; treatment; insoluble protein; antiinflammatory; immunosuppressive; antibacterial; antiprotozoal; treatment; meningococcal sepsis; cerebral malaria; autoimmune glomerulonephritis; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New homogeneous, insoluble proteins that bind tumor necrosis factor (TNF), useful for treating TNF-mediated disorders, e.g. inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Loetscher
                                                                                                                                                                                                      Human 55 kD TNFBP extracellular fragment PCR primer 2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Seguence 29 BP; 5 A; 7 C; 9 G; 8 T; 0 U; 0 Other;

The sequences given in AAQ51825-2266 represent areas of mRNAs which are associated with development or maintenance of chronic myelogenous content associated with development or maintenance of chronic myelogenous content as a content of the full pength as a containing these ranget sequences, encode aberant cellular proteins which are able to control cellular proteins and lung cancer. The full length mRNAs containing these target sequences, encode aberant cellular proteins which are able to control cellular proliferation and are directly linked to a leukemic phenotype. These target sequences are colonistically the tarboxyme of the invention. The riboxymes is formed in a hammerhead motif, but may also be formed in the motif of a hairpin, contained and the man and other animals by modulating expression of a transformed colls and transformed cells and that animals by modulating expression of the maturity end transformed state.

Whitiple drug resistance (mdr-1) mRNAs peorific riboxymes remove the mechanism of drug resistance used by transformed cells and thus enhances contain the animals may also be used to study genetic drift and mutations within cells. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New enzymatic RNA molecules (ribozymes) - which cleave mRNA associated with tumours or mRNA expressed from gene encoding multiple drug

The invention relates to polynucleotide inhibitors (I) and methods for inhibiting telomerase activity. (I) are useful in inhibiting telomerase activity. (I) are useful in inhibiting telomerase activity and poliferation of a telomerase positive cell, and in manufacturing a medicament for inhibiting telomerase activity in a cell and in treating telomerase-mediated condition or disease, such as adenocarcinoma of breast, prostate or colon, mixed cell leukaemia, adenocarcinoma of breast, prostate or colon, mixed cell leukaemia, cuseful in treating a tumour or in manufacturing a medicament for the useful in treating a tumour or in manufacturing a medicament for the circatum of tumour. The polynucleotide inhibitors may also be used in diagnostic assays for detecting RNA or DNA. Inhibition of telomerase cutvity in cells in vivo is useful in prophylactic and therapeutic methods of treating cancer and other disorders involving inappropriate expression of telomerase, and in treating veterinary proliferative diseases. Inhibition of telomerase in haematopoietic stem cells is useful for immunosuppression and for selectively down-regulating specific branches of the immune system. The present sequence represents human invention

The invention relates to novel immunogenic CpG oligodeoxymucleotides (AAC80581-C80723). The oligonucleotide are at least 10 bases long and comprise one of the generic sequences 5-NNNT-CpG-WNNN-3' or 5'-RY-CpG-RY -3'. The central CpG motif is unmerthylated, and the oligonucleotides optionally have phosphorothioate linkages which make them more resistant to degradation. The invention also relates to an oligonucleotide delivery complex comprising an oligonucleotide of the invention and a targetting agent, and a pharmaceutical composition comprising the oligonucleotide delivery complex. The oligonucleotides are able to induce either a cellmediated (T-cell) response or a humoral [B-cell, antibody) response, with oligonucleotides are able to induce a cellmediated response or a humoral response or a humoral response or a humoral response or a nuclear complex that after administration, the oligonucleotide acts on antigen-presenting cells celling to activation of natural killer (NK) cells. A cell-mediated or humoral response can then occur by activation of T or B-cells. The humoral response is useful for treating, preventing or meliorating an allergic reaction (preferably asthma), or an infection, where an immunogenic CpG oligonucleotide is administered either alone or

In combination with an anti-allergenic agent or anti-infectious agent. The allergic conditions which may be treated include eczema, allergic conditions, and the infections which may be treated include viral conditions, and the infections which may be treated include viral, bacterial, fungal and protozoal infections such as tuberculosis, AIDS, leishmania and schistosomiasis. Immune response induction may also be used in the treatment of an autoimmune disorder (e.g., lupus erythematosus, rheumatoid arthritis and multiple sclerosis) a disease associated with immune system deficiency, and symptomes resulting from exposure to an agent of biological warfare. An immunogenic CpG oligonucleotide, either alone or in combination with an anti-cancer agent, is useful for treating solid tumour cancer. The induction of an immune response is used in antisense therapy and to improve the efficacy of a vaccine. The oligonucleotide is preferably administered to Impunogenic CpG oligodeoxynucleotide of the invention

Set of oligonucleotides, useful for diagnosis and cell typing, : designed to detect single-nucleotide polymorphisms and cytosine designed to detect methylation status.

Claim 1; SEQ ID NO 25860; 29pp + Sequence Listing; German.

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, artdiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99989, ABF00010-ABF99989, ABF00010-ABF99989 and ABI00010-ABF82073

The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC9989, ABF00010-ABF9989, ABH00010-ABH9989 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                Set of oligonucleotides, useful for diagnosis and cell typing, i designed to detect single-nucleotide polymorphisms and cytosine methylation status.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ;

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC099889, ABF00010-ABF89889, ABF00010-ABF89899, ABF00010-ABF89899, ABF00010-ABF89899 and ABI00010-ABF82073 represent the oligomers described in the invention. NOTE: The sequence was obtained in electronic format from WIPO at the printed specification, but the wipo.int/pub/published_pct_sequence
This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically prereated genomic DNA.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ô
                                                                                                                                                                                                                                                            This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC091999, ABF00010-ABE99999, ABH00010-ABH99999 and ABI00010-ABH82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but the was obtained in electronic format from WIPO at

This invention describes novel oligonuclectide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonuclectides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABE99899, ABF00010-ABE99899, ABH00010-ABE99989 and ABI00010-ABE82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) cligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC99989, ABF00010-ABH99989 and ABI00010-ABH82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory,
                                                                                                                                                                                  This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABF82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WFPO at the printed specification, but ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.
                                          Set of oligonuclectides, useful for diagnosis and cell typing, idesigned to detect single-nuclectide polymorphisms and cytosine methylation status.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Oligonucleotide SEQ ID NO 132395 for detecting SNP TSC0033027
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              0.5%; Score 11.4; DB 1; Length 13; 92.3%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, ardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC99989, ABF00010-ABF9989, ABH00010-ABH99989 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                           Set of oligonucleotides, useful for diagnosis and cell typing, is designed to detect single-nucleotide polymorphisms and cytosine methylation status.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ;

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, ardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC9989, ABF00010-ABF99899, ABH00010-ABF99899 and ABI00010-ABF82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but the was obtained in electronic format from WIPO at fitte.wipo.int/pub/published_pct_sequences
SNP, single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Set of oligonucleotides, useful for diagnosis and cell typing, is designed to detect single-nucleotide polymorphisms and cytosine methylation status.
                                                                                                                                                                                                    .

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and merabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at

                                                                                                                                                                                                                                                                                                                                                                                                                      This invention describes novel oligonucleotide primars or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, aradiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC0010-ABC99989, ABF00010-ABF99899, ABH00010-ABH99989 and ABI00010-ABI32073 tepsesm the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.

This invention describes novel oligonuclectide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligomuclectides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and merabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABE99989, ABF00010-ABF99989, ABF00010-ABF99989 and ABI00010-ABF82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but the wipo int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Set of oligonucleotides, useful for diagnosis and cell typing, i designed to detect single-nucleotide polymorphisms and cytosine methylation status.
                                                                                                                                                                                                                             uer or oligonucleotides, useful for diagnosis and cell typing, i designed to detect single-nucleotide polymorphisms and cytosine methylation status.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

This invention describes novel oligonuclectide primers or peptide nucleic acid (PNA) eligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretraeted genomic DNA. The eligonuclectides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The coligomers are also used for detecting cell type differentiation. ABC00010-ABC99989, ABF00010-ABH99989 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at

Set of oligonucleotides, useful for diagnosis and cell typing, i designed to detect single-nucleotide polymorphisms and cytosine methylation status.

Claim 1; SEQ ID NO 125376; 29pp + Sequence Listing; German.

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, oligomers are also used for detecting call type differentiation. ABC00010 oligomers are also used for detecting call type differentiation. ABC00010 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cycosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, contral nervous system, ardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99989, ABF00010-ABF9989, ABH00010-ABH99989 and ABI00010-ABI82073 tepses the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                 SNP; single nucleotide polymorphism; human; diagnosis; PNA; cancer; CNS; peptide nucleic acid; cytosine methylation; cardiovascular; primer; ss; central nervous system; gastrointestinal; respiratory; immune; metabolic.

and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, cardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC9989, ABF00010-ABE9989, ABF00010-ABF99989 and ABI00010-ABI82073 represent the oligomers described in the invention. Set of oligonucleotides, useful for diagnosis and cell typing, is designed to detect single-nucleotide polymorphisms and cytosine methylation status.

Claim 1; SEQ ID NO 123787; 29pp + Sequence Listing; German.

This invention describes novel oligonucleotide primers or peptide nucleic acid (PNA) oligomers for detecting single nucleotide polymorphisms (SNP) and cytosine methylation status in chemically pretreated genomic DNA. The oligonucleotides are used for diagnosis and/or prognosis of cancer and a range of diseases including immune system, gastrointestinal, respiratory, central nervous system, ardiovascular and metabolic disorders. The oligomers are also used for detecting cell type differentiation. ABC00010-ABC99989, ABF00010-ABF99989, ABH00010-ABH99989 and ABI00010-ABI82073 represent the oligomers described in the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at
